Summary

Security automation engineer with hands-on experience building Python pipelines that parse SIEM/scanner output, score severity, and drive triage decisions, plus direct work integrating local LLMs into security tooling. Background spans VAPT, MITRE ATT&CK-based detection engineering, and CI/CD-integrated security testing.

Education

UPES , Dehradun, India <i>Bachelor of Technology - Cybersecurity and Forensics</i>	CGPA : 8.66 <i>August 2023 - Present</i>
--	---

Skills

Languages	Python, JavaScript, SQL, Bash, C , Java
Frameworks	FastAPI, Flask, Django, REST APIs, Git, CI/CD
Security Tools	SIEM, EDR/XDR-adjacent telemetry, VAPT, Burp Suite, Metasploit, Wireshark
Platforms	Docker, PostgreSQL, MySQL, SQLite, Linux, AWS, GCP

Experience

Indian National Space Promotion and Authorization Center (IN-SPACE) <i>Security Operations & Automation Intern</i>	Ahmedabad, India <i>June 2026 – Present</i>
○ Built an automated triage pipeline for Sysmon, Event Log, and Audit Log artifacts, cutting triage time by 45%. ○ Built an async threat-correlation engine that auto-scored incidents using open-source threat intelligence. ○ Mapped 100+ incidents to MITRE ATT&CK and generated detection coverage reports for automation planning.	
Sentientia Quality AI <i>Cybersecurity Intern</i>	<i>Jan 2026 – Feb 2026</i>
○ Built a CI/CD security-testing pipeline to detect firmware injection vulnerabilities before deployment. ○ Performed VAPT and threat-modeling assessments across five embedded products, strengthening firmware security. ○ Applied model quantization and pruning to reduce neural network size by 45% for edge inference.	
Indian Space Research Organisation (ISRO) <i>Security Engineering Intern</i>	Ahmedabad, India <i>June 2025 – July 2025</i>
○ Built a cyber range with seven ATT&CK-aligned attack simulations, reducing manual assessment effort by 60%. ○ Developed automated validation routines to verify SIEM and EDR alerts against expected attack outcomes. ○ Automated evidence collection and reporting, reducing investigation turnaround from hours to under 30 minutes.	

Projects

ATLAS VAPT Toolkit <i>Python, VAPT, Network Security, Web Auditing</i>	github.com/b1tw1z/ATLAS <i>Jan 2026 – Present</i>
○ Built a modular VAPT framework that scans web services for injection risks, transport flaws, and misconfigurations. ○ Automated scan-to-report pipeline into structured compliance reports, reducing manual reporting effort by 50%+. ○ Validated the toolkit against live targets, uncovering SQLi and configuration issues missed during manual review.	
Password Strength Analyzer Suite <i>Python, Flask, Local LLM (llama-cpp-python), SSE Streaming</i>	github.com/b1tw1z/Password-Strength-Analyzer <i>Feb 2026 – Mar 2026</i>
○ Combined rule-based analysis, Shannon entropy, and zxcvbn into a unified offline password assessment suite. ○ Implemented Server-Sent Events to stream brute-force time estimates, reducing perceived UI latency by 50%. ○ Integrated a local LLM with llama-cpp-python for private password diagnostics without external APIs.	
DOMe Malicious Domain Engine <i>FastAPI, React, Bi-LSTM, Random Forest, XGBoost</i>	github.com/b1tw1z/DOme <i>Apr 2026 – May 2026</i>
○ Trained a hybrid Bi-LSTM, Random Forest & XGBoost ensemble achieving 94%+ domain classification accuracy. ○ Built an asynchronous FastAPI backend with a React dashboard for high-throughput batch domain analysis. ○ Automated DNS resolution logging and threat visualization to identify malicious domains in near real time.	

Certifications

ISC2 Certified in Cybersecurity (CC)	Oct 2025
Google Cybersecurity Professional Certificate	Jul 2025
Google Cloud Career Practitioner Pathway	Nov 2024
